Project Design Phase
Proposed Solution Template

Date	15 February 2025
Team ID	LTVIP2026TMIDS80982
Project Name	Prosperity Prognosticator: Machine Learning for Startup Success Prediction
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1	**Problem Statement (Problem to be solved)**	Many startups fail due to poor strategic planning, insufficient funding management, and lack of predictive insights. Investors and entrepreneurs struggle to assess whether a startup will succeed or fail. Traditional evaluation methods are manual, subjective, and do not effectively analyze complex business factors such as funding rounds, milestones, and relationship networks.
2	**Idea / Solution Description**	Develop a Machine Learning based startup success prediction system that analyzes historical startup data including funding details, milestones achieved, relationships, and participation metrics. The system predicts whether a startup is likely to be Acquired (Successful) or Closed (Failed) and provides quick decision support through a web-based application.
3	**Novelty / Uniqueness**	The solution uses advanced ML classification algorithms such as Random Forest to identify hidden patterns influencing startup success. Instead of relying on manual evaluation, the system provides data-driven, probability-based predictions, improving decision accuracy and reducing business risk.
4	**Social Impact / Customer Satisfaction**	The system supports entrepreneurs by providing insights to improve business strategy and sustainability. It helps investors reduce financial risk and make informed investment decisions. By promoting data-driven evaluation, the solution encourages responsible funding and strengthens the startup ecosystem.
5	**Business Model (Revenue Model)**	The solution can be offered as a SaaS (Software as a Service) platform for investors, incubators, and venture capital firms on a subscription basis. Revenue can also be generated through API integration services, enterprise licensing, and analytics dashboard features for premium users.
6	**Scalability of the Solution**	The system follows a 3-tier architecture (Frontend, Backend, Database) and can be deployed on cloud platforms. It can scale by increasing computational resources and database capacity to handle large startup datasets and multiple users simultaneously. The architecture supports

S.No.	Parameter	Description
		future integration of additional predictive features and advanced analytics.
